Spoken Tutorial on Core Terminology

Module	AI Essentials
Episode	3. Core Terminology
Learning Objective	At the end of this tutorial learner will be able to 1. Define core AI terminology including models, training, prompts, LLMs, and inference. 2. Explain the interconnected roles of models, datasets, and training in AI development. 3. Apply effective prompting techniques to interact with large language models. 4. Compare various examples of large language models like GPT, Gemini, and Llama.
Approx. Duration	3-4 min
Outline	• Model and its role • Training and datasets • Prompts and user instructions • LLMs and common examples • Inference as the output-generation step
Meta Tags	AI, Generative AI, Core Terminology, Model, Training, Datasets, Prompts, LLMs, Inference, GPT, Gemini, Llama, AI Essentials
Pre-requisite Tutorial	Intro to Generative AI

Visual Cue	Narration
Title Slide	Welcome to this Spoken Tutorial on **Core Terminology**.
Learning Objectives Slide	In this tutorial, you will learn to, • Define core **AI** terminology including **models**, **training**, **prompts**, **LLMs**, and **inference**. • Explain the interconnected roles of **models**, **datasets**, and **training** in **AI** development. • Apply effective **prompting** techniques to interact with large language models. • Compare various examples of large language models like **GPT**, **Gemini**, and **Llama**.
System Requirements Slide	Here I am using a browser on a computer or mobile.
Pre-requisite Slide	To follow this tutorial, you should complete 'Intro to **Generative AI**'. This is Episode 2 of our module.

Person at laptop, illustration of a chef following a recipe	What exactly is an **AI model**? An **AI model** is a computer program. It is trained to perform specific tasks. Think of it like a chef following a recipe. The chef learns from ingredients and techniques to create a dish. Similarly, an **AI model** learns to perform its task.
Person at laptop, illustration of a student learning from many textbooks and datasets	Now that we understand **AI models**, how do we train them? **Training** an **AI model** means feeding it vast amounts of data. This data is called **datasets**. It's like a student learning from many textbooks and examples. This helps the student master a subject. With enough **datasets**, the **AI model** learns its task.
Person at laptop, illustration of different LLM logos (GPT, Gemini, Llama) with text bubbles	Among **AI models**, some are specialized for language. These are called **Large Language Models**, or **LLMs**. **LLMs** are advanced **AI models**. They are skilled in understanding and generating human language. Think of a highly skilled translator or writer. Examples include **GPT**, **Gemini**, and **Llama**.
Screen close-up: user typing 'Write about cats...'	How do we interact with **LLMs**? We use **prompts**. **Prompts** are instructions you give to an **AI**. Let's look at a vague **prompt** now. If you simply say, 'Write about cats', what happens? The **AI** gives broad, unspecific results. It's like asking a friend to 'tell me something interesting'. This is without any context.
Screen close-up: user typing 'Write a 3-paragraph humorous story about a cat's misadventures, set in a library...'	But what if we want specific, creative output? We need an improved **prompt**. An improved **prompt** gives clear instructions. It adds context and specifies the desired format. For example, try this **prompt**: 'Write a 3-paragraph humorous story about a cat's misadventures. Set it in a library.' This yields specific and creative output.
Side-by-side: vague prompt output vs improved prompt output	Let us compare the outputs. The vague **prompt** gives generic information. The improved **prompt** generates a targeted, engaging story. This highlights the power of precise instruction. See the difference?

Illustration showing an AI model processing input and generating output, like a calculator performing a calculation	Once we give a **prompt**, the **AI** generates an output. This process is called **inference**. **Inference** is when a trained **AI model** uses new input. It then generates an output. Think of a calculator. It performs a calculation based on the numbers you input. That calculation is similar to **inference**.
Summary Slide	Let us summarize what we learned. We defined core **AI** terms. These included **models**, **training**, and **datasets**. We also covered **LLMs**, **prompts**, and **inference**. We also saw how effective **prompting** guides **AI** output.
Assignment Slide	Now as an assignment, Experiment with an **LLM** of your choice. Give it a vague **prompt** first. Then, refine it into an improved **prompt.** Compare the results.
