

Spoken Tutorial on Introduction to Building with AI

Module	Module 3: An Introduction to Building with AI
Tutorial	3. Introduction to Building with AI
Learning Objective	At the end of this tutorial learner will be able to 1. Define what an API is. 2. Explain the purpose of an API key. 3. Identify components of an API request.
Approx. Duration	3-4 min
Outline	• API Analogy • API Key • API Request
Meta Tags	AI, API, API Key, API Request, Building with AI, Spoken Tutorial, AI Essentials, Application Programming Interface, AI Models, Authentication
Pre-requisite Tutorial	Module 2: Introduction to Prompting

Script

Visual Cue	Narration
Title Slide	Welcome to this Spoken Tutorial on Introduction to Building with AI.
Learning Objectives Slide	In this tutorial, you will learn to, • Define what an API is. • Explain the purpose of an API key. • Identify components of an API request.
System Requirements Slide	Here I am using a browser on a computer or mobile.
Pre-requisite Slide	To follow this tutorial, you should have completed Module 2: Introduction to Prompting.
Illustration showing a restaurant waiter taking an order from a customer (application), carrying it to the kitchen (AI model), and bringing back food (response).	Have you ever wondered how apps talk to powerful AI models? They use something called an API . API stands for Application Programming Interface . Think of an API like a restaurant waiter. You give your order to the waiter. The waiter takes your order to the kitchen. The kitchen prepares your food. Similarly, your application gives instructions to the API . The API delivers these instructions to an AI model. The AI model processes them and sends back a response.

Illustration of a person showing an ID card to gain access, representing authentication, with a lock icon.	How does the AI model know who is sending the request? This is where an API key comes in. An API key is a secret password. It identifies you as an authorized user. Imagine it like your restaurant ID card. This card proves you are allowed to order food. Similarly, your API key authenticates your application. It ensures only authorized users access the AI model.
Screen close-up: user typing 'tomato' into the search bar of a grocery app on a smartphone.	Let's see how this works in real life. Open any grocery app on your phone. Tap the search bar at the top. Type 'tomato' and press search. Behind the scenes, the app sends a request to the API. The API searches for all matching products. The server sends back a list of results. You now see all tomato products on your screen. This is an API in action!
Illustration showing a person (application) handing an order slip (API request) to a waiter, with a small key icon on the slip for authentication and text 'prompt' on the order.	Now that we know about APIs and API keys, what about the actual communication? This communication is called an API request. An API request is like placing your order at the restaurant. It includes your API key for authentication. It also contains your instructions for the AI model. These instructions are often called a prompt. So, you send a structured API request. This request tells the AI model what to do. It's how you ask the AI model for a specific task.
Summary Slide	Let us summarize what we learned. We defined APIs as messengers. We understood API keys as identification. We learned about API requests as structured orders to AI models.
Assignment Slide	Now as an assignment, Identify other real-life applications using APIs. Consider what information their API requests might include. Compare the results.
