

Spoken Tutorial – Introduction to Python for AI

Title: Introduction to Python for AI

Module	AI Essentials
Episode	1. Python Crash Course for AI
Learning Objective	At the end of this tutorial learner will be able to 1. Understand why Python is key for AI, set up Google Colab, and apply basic Python concepts like variables, strings, lists, dictionaries, and functions.
Approx. Duration	3-4 min
Outline	• Why Python is the language of AI • Using Google Colab (No Installation Needed!) • Python Essentials: Variables • Python Essentials: Strings • Python Essentials: Lists • Python Essentials: Dictionaries • Python Essentials: Functions
Meta Tags	Python, AI, Google Colab, Variables, Strings, Lists, Dictionaries, Functions, Coding, Programming, Machine Learning
Pre-requisite Tutorial	Basic internet usage

Script

Visual Cue	Narration
Title slide with 'Introduction to Python for AI' and 'Python Crash Course for AI' prominently displayed, perhaps with a subtle AI-themed background.	Welcome to this Spoken Tutorial on Python Crash Course for AI.
Learning objectives slide with bullet points matching the content, clear and easy to read.	In this tutorial, you will learn: Why Python is key for AI. How to use Google Colab. And basic Python concepts.
System requirements slide showing icons for a web browser and an internet connection.	To practice along, you will need: A web browser. And an active internet connection.
Prerequisites slide with text 'Basic internet usage' and a simple icon of a person using a computer.	To follow this tutorial, learners should know: Basics of using the internet.
Illustration showing Python logo connected to AI concepts, with text bubbles indicating 'easy to read' and 'powerful tools'.	Why Python? It's the language of AI. It's famous for being easy to read. It almost looks like plain English. The global community built incredible free tools for it. These make working with AI much simpler.

Screenshot of Google Colab's landing page or a new blank notebook, emphasizing 'no installation'.	Forget complex setups. We will use Google Colab. It is a free tool from Google. You can run Python code in your browser. No installation is needed.
Screen recording showing a user navigating to colab.research.google.com and clicking the 'New notebook' button.	Let's open Google Colab. First, open your web browser. Then go to colab.research.google.com. Just open a new "notebook". And you're ready to go.
A minimalist slide with 'The Only Python You Need' as the main title, perhaps a stylized clock indicating '5-Minute Crash Course'.	Now, for the crash course. Here are the absolute essentials. This is the only Python you need to start.
A visual metaphor of a labeled box with "Smart Coffee Mug" written on the box and inside, labeled "product_name".	Think of a variable as a labeled box. You store information inside it. For example, product_name = "Smart Coffee Mug". Here, product_name is our variable.
A simple graphic showing text enclosed in quotation marks, highlighting the concept of a string.	A "string" is a piece of text. You create one by wrapping text in quotes. In our example, "Smart Coffee Mug" is a string.
A visual representation of a grocery list or a bulleted list of items, with square brackets around them.	A list holds multiple items. They are kept in order. Always inside square brackets []. For example, features = ["Temperature Control", "Wireless Charging", "Digital Display"]. This is a list of features for our product.
A visual metaphor of a dictionary with words and their definitions, or a key-value data structure.	A dictionary stores information. It uses key-value pairs. These go inside curly braces {}. It's perfect for organizing related data. For example, product_details stores product details. It has a name, price, and stock status.
A visual metaphor of a machine that takes an input (name) and produces an output (greeting), with the code example displayed.	A function is a reusable block of code. It performs a specific action. You define it once. Then you can use it over and over. Here is an example. We define create_greeting. It generates a welcome message. Then we use it to greet Alex.
Summary slide with bullet points summarizing key takeaways.	With this, we come to the end of this tutorial. Let us summarise. We saw why Python is crucial for AI. We learned about Google Colab for easy coding. And we covered essential Python concepts.

Assignment slide with bullet points for the task, perhaps an icon of a person coding or a chef's hat.	As an assignment, please do the following. Open a new Google Colab notebook. Create variables for your favorite food. Make a list of its ingredients. Create a dictionary with its nutritional information. Write a function to print a recipe step. Then call that function.
Thank you slide with EduPyramids, SINE, and IIT Bombay logos.	This Spoken Tutorial is brought to you by EduPyramids Educational Services Private Limited. It is also brought by SINE and IIT Bombay. Thank you for joining!
