

Spoken Tutorial on Understanding APIs

Module	Building
Episode	2. Understanding APIs
Learning Objective	At the end of this tutorial learner will be able to 1. Define what an API is and its significance. 2. Explain the role of an API as a connector in AI applications. 3. Describe how API keys ensure secure access and authentication. 4. Apply the concept of API interaction to send requests and receive AI-generated responses.
Approx. Duration	3-4 min
Outline	• What an API is • API as a connector • Prompts as inputs • API keys for authentication • Request-response flow
Meta Tags	API, Artificial Intelligence, AI, connection, requests, responses, models, authentication, API keys, Python, programming, development, tutorial
Pre-requisite Tutorial	Python basics for API

Script

Visual Cue	Narration
Title Slide	Welcome to this Spoken Tutorial on Understanding APIs .
Learning Objectives Slide	In this tutorial, you will learn to, • Define what an API is and its significance. • Explain the role of an API as a connector in AI applications. • Describe how API keys ensure secure access and authentication. • Apply the concept of API interaction to send requests and receive AI-generated responses.
System Requirements Slide	Here I am using a browser on a computer or mobile.
Pre-requisite Slide	To follow this tutorial, you should have Python basics for API .

Illustration showing API as a messenger between two systems, with data flowing back and forth.	What is an API? An API, or Application Programming Interface, is a messenger. It takes your requests to a system. Then, it brings the system's response back to you. APIs are crucial for software communication. They help different programs share data. Think of it like a universal remote for devices.
Illustration showing a prompt being sent to an AI model via an API, with a key icon representing API keys for secure access.	What about inputs, outputs, and security? Prompts are the specific inputs you send. These go through an API to an AI model. A prompt tells the model what task to do. For secure access to these services, we use API keys. API keys are credentials for authentication. They control who can access the system.
Diagram showing an application sending a request with a prompt to an AI model through an API, and receiving an AI-generated response.	How do applications interact with AI? Applications send structured requests. These requests contain prompts and parameters. They go to an AI model via its API. The model processes your input. Then, it sends back an AI-generated response. This completes the interaction cycle.
Summary Slide	Let us summarize what we learned. We defined APIs as essential connectors. We discussed prompts as inputs. We understood API keys for security. And we explored the request-response flow for AI interaction.
Assignment Slide	Now as an assignment, Explore an open-source API documentation. Identify its key endpoints and authentication methods. Compare the results.
